ACCOR · POWERED BY CLAUDE · BUILT ON DOMO

Accor | AI-Powered Menu Compliance for Restaurants & Bars

A Claude-powered Domo application that reads food and bar menus, checks them against each hotel's license, and approves, rejects or routes them for review.

Any format
menu PDFs parsed regardless of language, layout or design

Food + bar
both menu types checked against each hotel's license

3 paths
auto-approve, human review or auto-reject, set by guardrails

THE CLIENT

Accor is a global hospitality group headquartered in France, operating hotels, restaurants and bars across a broad portfolio of brands. In France, each hotel's restaurant and bar operates under a license that sets the mandatory and optional items its food and bar menus must include, and every menu has to be reviewed against those terms. GWC Data.AI built a Claude-powered, pro-code application on Domo to digitize that process.

WHAT ACCOR NEEDED

- **Faster menu compliance:** every hotel's food and bar menus had to be checked against the mandatory items in its license, a slow manual review.
- **Handling unstructured menus:** menus arrived as PDFs and images in different languages, layouts and designs, often naming the same item in different ways.
- **Consistent decisions:** approvals and rejections depended on individual reviewers working through Excel sheets and documents.
- **Control where it matters:** clear-cut menus should be decided automatically, while borderline cases still get a human check.
- **Visibility and tracking:** a single place to track submissions, decisions and compliance across hotels.

THE APPLICATION GWC BUILT

A menu compliance agent on Domo

A pro-code Domo application, powered by Claude, that turns unstructured menu PDFs into license-checked, tracked decisions.

01
Upload
Hotels upload one or more food and bar menu PDFs into the Domo application.

02
Parse
Claude reads each menu in any language or layout and recognizes items named with synonyms.

03
Compare
Items are matched against the hotel's license to confirm mandatory and optional elements.

04
Decide
Guardrails approve, reject or route the menu to a reviewer, and results feed the dashboards.

GUARDRAILS: MATCH SCORE AGAINST THE LICENSE

90% AND ABOVE
Auto-approved
Menu meets the license, with every mandatory item present.

80% TO 90%
Human in the loop
A reviewer checks and approves or rejects. Any manual edit after parsing also routes here.

BELOW 80%
Auto-rejected
Also applies whenever a mandatory item is missing.

BEFORE

Hotels sent menus as PDFs and images, and admins reviewed each one by hand, often in Excel, to approve or reject it.

AFTER

Menus are uploaded, checked and decided in one application, with reviewers focused only on borderline cases and dashboards tracking every submission.

THE IMPACT

- **Significant hours saved:** manual menu reviews are replaced by AI-driven checks, saving many hours across hotels and admin teams.
- **A digitized, streamlined process:** submission, review and approval run in one application instead of emails, PDFs and spreadsheets.
- **Consistent, trackable decisions:** every menu is scored against the same license rules, with dashboards to track status and compliance.
- **Human judgment where it counts:** guardrails send only borderline or edited menus to reviewers.

WHY CLAUDE AS THE FOUNDATION MODEL

- **Reading unstructured documents:** parses menus in any language, layout or design, straight from PDFs.
- **Understanding meaning, not keywords:** recognizes items described with synonyms or local names and maps them to license requirements.
- **Reliable, explainable scoring:** produces a match score and shows which mandatory items are present or missing.
- **Enterprise-grade:** supports controlled, repeatable workflows with human-in-the-loop review built in.

WHY GWC

- **AI partner for document intelligence:** parsing, compliance checks and human-in-the-loop decision systems.
- **Domo and pro-code expertise:** custom Domo applications and dashboards that put AI into everyday workflows.
- **Innovation Lab:** a sprint-based build engine (Meaningful, Methodical, Measurable) focused on production-ready AI solutions.
- **Full-stack ownership:** data → AI → insight → action, one partner, one accountability.

Every menu checked, every decision tracked. www.gwcdata.ai
