CAREABOUT HEALTH · POWERED BY CLAUDE

CareAbout Health | Claude-Powered Engineering & Operations Intelligence

Using Claude to diagnose and fix data pipeline and cloud failures, power user-facing insights, and build a resilient multi-model AI foundation.

Every run
failed pipeline and cloud run explained, with a recommended fix

Claude-first
engineering and data operations, with no manual log analysis

Opus + Sonnet
multi-model orchestration now in development

THE CLIENT

CareAbout Health is a healthcare organization focused on value-based care, where outcomes depend on reliable data flowing across clinical, operational and financial systems. Its engineering and data teams run the pipelines and cloud infrastructure behind that work, and Claude has become central to how they build, operate and support their applications. GWC Data.AI works alongside these teams as an embedded engineering partner.

WHAT CAREABOUT HEALTH NEEDED

- **Faster failure resolution:** pipeline and cloud failures took engineering time to trace through logs before anyone could fix them.
- **Less manual operations work:** routine investigation and troubleshooting pulled engineers away from building.
- **Insights for end users:** users of the organization's applications needed quick, plain-language answers to their questions.
- **Resilient AI at scale:** AI workloads needed to keep running even when a single model was busy or unavailable.
- **Controlled AI costs:** growing usage called for active token and cost optimization.

THE AGENT GWC BUILT

Pipeline & cloud failure analysis agent

When a data pipeline or cloud job fails, engineers ask the agent what went wrong. Claude investigates, explains the root cause and proposes the fix.

01

Ask

An engineer describes the problem in plain language, such as asking why a pipeline run failed.

02

Analyze

The agent calls the relevant APIs, pulls the run and error details, and works out why the failure happened.

03

Resolve

It explains the issue and recommends a fix for each failed run, ready for the team to apply.

BEFORE

Engineers traced failures by reading through logs and error output by hand before they could start on a fix.

AFTER

One prompt returns the cause and a recommended fix for every failed run, with no manual log analysis.

CLAUDE ACROSS THE ORGANIZATION

Claude-first engineering

Claude is part of day-to-day engineering and data work, from building to troubleshooting.

User-facing insights assistant

A conversational assistant in the organization's application answers user questions with insights.

Next: multi-model orchestration

Routes work across Claude Opus and Sonnet, switching models when one is busy, with token-cost optimization built in.

THE IMPACT

- **Faster root-cause analysis:** failed pipeline and cloud runs come with a clear explanation and a recommended fix.
- **No manual log analysis:** engineers no longer sift through logs by hand to find why a run failed.
- **More time for building:** routine troubleshooting moves to the agent, freeing engineering capacity.
- **A foundation for scale:** multi-model routing and token-cost optimization prepare AI workloads to grow reliably.

WHY CLAUDE AS THE FOUNDATION MODEL

- **Reasoning over logs and errors:** reads complex error output and explains root causes in plain language.
- **Tool use through APIs:** the agent gathers run and failure details itself instead of relying on copy-pasted logs.
- **A range of models:** Opus for deep reasoning and Sonnet for speed and cost, enabling smart routing and cost control.
- **Enterprise-grade:** supports controlled, explainable workflows suited to a healthcare environment.

WHY GWC

- **Embedded engineering partner:** GWC engineers work inside the client's data and cloud operations, building agents alongside their team.
- **Enterprise AI and data expertise:** data engineering, cloud operations, Agentic AI and multi-model architectures.
- **Innovation Lab:** a sprint-based build engine (Meaningful, Methodical, Measurable) focused on production-ready AI solutions.
- **Full-stack ownership:** data → AI → insight → action, one partner, one accountability.

Less time troubleshooting, more time delivering value-based care.
