CONNECTWISE · POWERED BY CLAUDE

ConnectWise | AI-Powered Lead-to-Cash Back-Office Agent

Monitoring, auto-fixing and escalating Salesforce → Boomi → NetSuite integration issues with Claude and Boomi MCP.

Zero
orders missed across the lead-to-cash process

L1 + L2
issue handling taken on by the agent

3 systems
Salesforce, Boomi and NetSuite, watched by one agent

THE CLIENT

ConnectWise is a global software company serving managed service providers (MSPs) and IT solution providers. Its platform spans professional services automation (PSA), remote monitoring and management (RMM), cybersecurity management, data protection and automation, helping technology businesses run, secure and grow their operations. GWC Data.AI partners with ConnectWise to apply Claude to its back-office operations.

WHAT CONNECTWISE NEEDED

- **A reliable lead-to-cash flow:** orders, accounts and billing data had to move cleanly from Salesforce to NetSuite through Boomi middleware.
- **Faster issue resolution:** integration errors, orphan records and fallouts needed to be caught and corrected before they affected orders or invoicing.
- **Less manual L1/L2 effort:** operations and support teams were triaging and fixing routine integration issues by hand.
- **Protected revenue:** every missed or stuck order is a source of revenue leakage.
- **Trusted data:** consistent, accurate records across CRM, integration and ERP systems.

THE AGENT GWC BUILT

One back-office agent for lead-to-cash

Built with Claude and Boomi MCP, the agent connects to Salesforce, Boomi and NetSuite and watches every hand-off in the lead-to-cash process.

Salesforce
CRM: leads, opportunities and orders

→

Boomi
Integration middleware

→

NetSuite
ERP: sales orders and billing

Claude back-office agent — Connected through Boomi MCP · monitors all three systems

HOW THE AGENT WORKS

01

Detect

Continuously checks the lead-to-cash flow for integration errors, orphan records and fallouts.

02

Auto-fix

Resolves the issues it can safely correct on its own, restoring clean records without manual effort.

03

Alert & escalate

Sends alerts with context to the operations or support team for issues that need a human decision.

BEFORE

Integration issues, orphan records and fallouts between Salesforce and NetSuite were found and fixed manually by operations and support teams, with the risk of orders slipping through.

AFTER

The agent handles L1 and L2 issues itself, auto-fixing what it can and escalating the rest, so teams focus only on the exceptions that need judgment.

THE IMPACT

- **Zero missed orders:** every order in the Salesforce → Boomi → NetSuite flow is accounted for.
- **Revenue leakage stopped:** fallouts are caught and resolved before they turn into lost or delayed revenue.
- **Higher data accuracy:** orphan records and mismatches are corrected, keeping CRM and ERP data in sync.
- **L1 and L2 handled by the agent:** operations and support teams are freed from routine triage and fixes.

WHY CLAUDE AS THE FOUNDATION MODEL

- **Reasoning across systems:** follows records as they move between Salesforce, Boomi and NetSuite and pinpoints where the flow breaks.
- **Tool use through MCP:** works with Boomi through MCP to inspect integrations and act on issues, not just report them.
- **Judgment on when to act:** separates issues it can safely auto-fix from those that need a person, and explains why.
- **Enterprise-grade:** supports controlled, explainable and repeatable back-office workflows.

WHY GWC

- **AI partner for back-office operations:** agentic automation, integration monitoring and human-in-the-loop decision systems.
- **Integration and ERP expertise:** Salesforce, Boomi, NetSuite and end-to-end lead-to-cash processes.
- **Innovation Lab:** a sprint-based build engine (Meaningful, Methodical, Measurable) focused on production-ready AI solutions.
- **Full-stack ownership:** data → AI → insight → action, one partner, one accountability.
